

365 Data Science SQL Basics – Topic 2.2: Logical Operators & Precedence

Exhaustive Notes on AND, OR, NOT & Explicit Operator Precedence

1. Logical Operators: AND, OR, NOT

• `AND`: Requires both conditions to be TRUE. • `OR`: Requires at least one condition to be TRUE. • `NOT`: Inverts boolean logic (`NOT WHERE ...`).

2. Operator Precedence & Parentheses Rules

SQL evaluates `AND` before `OR`. Always use parentheses `()` to explicitly define intended logical evaluation order.

```
-- Operator Precedence Example
SELECT * FROM employees
WHERE last_name = 'Denis' AND (gender = 'M' OR gender = 'F');
```

3. Topic 2.2 Viva Q&A

1. Q: Which operator has higher precedence: AND or OR? A: `AND` has higher logical precedence than `OR`.
