

Chapter 10: React Routing

Section 10.1: Example Routes.js file, followed by use of Router Link in component

Place a file like the following in your top level directory. It defines which components to render for which paths

```
import React from 'react';
import { Route, IndexRoute } from 'react-router';
import New from './containers/new-post';
import Show from './containers/show';

import Index from './containers/home';
import App from './components/app';

export default(
  <Route path="/" component={App}>
    <IndexRoute component={Index} />
    <Route path="posts/new" component={New} />
    <Route path="posts/:id" component={Show} />

  </Route>
);
```

Now in your top level index.js that is your entry point to the app, you need only render this Router component like so:

```
import React from 'react';
import ReactDOM from 'react-dom';
import { Router, browserHistory } from 'react-router';
// import the routes component we created in routes.js
import routes from './routes';

// entry point
ReactDOM.render(
  <Router history={browserHistory} routes={routes} />
  , document.getElementById('main'));
```

Now it is simply a matter of using `Link` instead of `<a>` tags throughout your application. Using `Link` will communicate with React Router to change the React Router route to the specified link, which will in turn render the correct component as defined in routes.js

```
import React from 'react';
import { Link } from 'react-router';

export default function PostButton(props) {
  return (
    <Link to={`posts/${props.postId}`}>
      <div className="post-button" >
        {props.title}
        <span>{props.tags}</span>
      </div>
    </Link>
  );
}
```

Section 10.2: React Routing Async

```
import React from 'react';
import { Route, IndexRoute } from 'react-router';

import Index from '../containers/home';
import App from '../components/app';

//for single Component lazy load use this
const ContactComponent = () => {
  return {
    getComponent: (location, callback)=> {
      require.ensure([], require => {
        callback(null, require('../components/Contact')["default"]);
      }, 'Contact');
    }
  };
};

//for multiple componnets
const groupedComponents = (pageName) => {
  return {
    getComponent: (location, callback)=> {
      require.ensure([], require => {
        switch (pageName) {
          case 'about' :
            callback(null, require( "../components/about" )["default"]);
            break ;
          case 'tos' :
            callback(null, require( "../components/tos" )["default"]);
            break ;
        }
      }, "groupedComponents");
    }
  };
};

export default(
  <Route path="/" component={App}>
    <IndexRoute component={Index} />
    <Route path="/contact" {...ContactComponent()} />
    <Route path="/about" {...groupedComponents('about')} />
    <Route path="/tos" {...groupedComponents('tos')} />
  </Route>
);
```
